Practical Title: Student Management CRUD with Search and Filter.

Create a student management module to add, view, edit, delete, search and filter student records. All database operations must use MYSQLi statements and clear success/failure messages.

A. Theory

1. Answers to key questions

1. Are SELECT, INSERT, UPDATE, and DELETE operations working?

Yes. SELECT displays student records, INSERT adds new records, UPDATE edits existing records, and DELETE removes records from the database.

2. Is search by name/email/course implemented?

Yes. A search input can filter student records by name, email, or course using a prepared SQL statement.

3. Are delete operations confirmed before execution?

Yes. A JavaScript confirmation dialog asks the user to confirm before deleting a student record.

Implementation/ Output/Result

Demo code:

```
CREATE DATABASE p11_demo;

USE p11_demo;

CREATE TABLE students (
    id INT AUTO_INCREMENT PRIMARY KEY,
    name VARCHAR(100),
    email VARCHAR(100),
    course VARCHAR(30)
);

<?php
$conn = new mysqli("localhost", "root", "", "p11_demo");

if ($conn->connect_error) {
    die("Connection failed");
}

$message = "";

if (isset($_POST["add"])) {
    $name = trim($_POST["name"]);
```

```
    $email = trim($_POST["email"]);
    $course = $_POST["course"];

    if ($name === "" || !filter_var($email, FILTER_VALIDATE_EMAIL)) {
        $message = "Enter valid details";
    } else {
        $stmt = $conn->prepare(
            "INSERT INTO students (name,email,course) VALUES (?,?,?)"
        );
        $stmt->bind_param("sss", $name, $email, $course);
        $message = $stmt->execute()
            ? "Student added successfully"
            : "Failed to add student";
    }
}

if (isset($_POST["delete"])) {
    $id = (int)$_POST["id"];
    $stmt = $conn->prepare("DELETE FROM students WHERE id=?");
    $stmt->bind_param("i", $id);

    $message = ($stmt->execute() && $stmt->affected_rows > 0)
        ? "Student deleted successfully"
        : "Student not found";
}
```

```
$search = trim($_GET["search"] ?? "");
$term = "%".$search."%";

$stmt = $conn->prepare(
    "SELECT * FROM students WHERE name LIKE ? OR email LIKE ?"
);
$stmt->bind_param("ss", $term, $term);
$stmt->execute();
$result = $stmt->get_result();
?>

<h2>Student Management</h2>
<p><?= htmlspecialchars($message) ?></p>

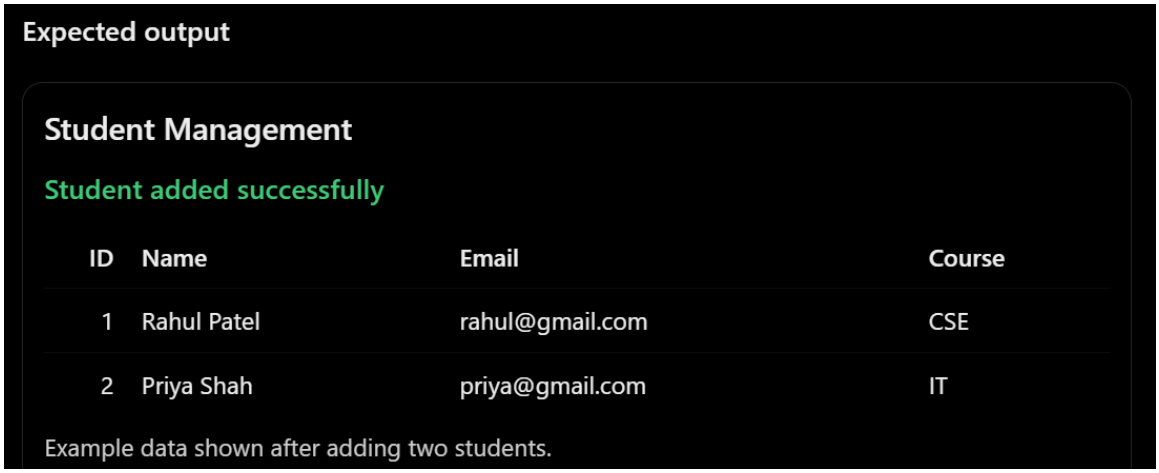

<form method="post">
    <input name="name" placeholder="Name" required>
    <input type="email" name="email" placeholder="Email" required>
    <select name="course">
        <option>CSE</option>
        <option>IT</option>
        <option>CE</option>
    </select>
    <button name="add">Add Student</button>
</form>
```

```
<form method="get">
    <input name="search" placeholder="Search by name or email">
    <button>Search</button>
</form>

<table border="1" cellpadding="8">
<tr><th>ID</th><th>Name</th><th>Email</th><th>Course</th><th>Action</th></tr>

<?php while ($s = $result->fetch_assoc()): ?>
<tr>
    <td><?= (int)$s["id"] ?></td>
    <td><?= htmlspecialchars($s["name"]) ?></td>
    <td><?= htmlspecialchars($s["email"]) ?></td>
    <td><?= htmlspecialchars($s["course"]) ?></td>
    <td>
        <form method="post"
              onsubmit="return confirm('Delete this student?')">
            <input type="hidden" name="id" value="<?= (int)$s["id"] ?>">
            <button name="delete">Delete</button>
        </form>
    </td>
</tr>
<?php endwhile; ?>
</table>
```

Expected output

- Created a student management interface.
- Connected PHP to the MySQL database using MySQLi.
- Implemented SELECT to display student records.
- Implemented INSERT to add student records.
- Implemented UPDATE to edit student details.
- Implemented DELETE with confirmation.
- Added search by name, email, or course.
- Displayed appropriate success and failure messages.

Learning Outcomes:

Learned to implement secure student CRUD operations with MySQLi, search, filtering, and user feedback.
