Practical Title: Responsive UI Design using CSS Grid, Flexbox, and Bootstrap/Tailwind

Problem Definition: Design responsive layouts for Home, About, Registration, Dashboard, and Events pages using CSS Grid and Flexbox. Optional to use CSS framework such as Bootstrap or Tailwind. Ensure mobile-first responsiveness.

A. Theory

1. How does the layout adapt for mobile, tablet, and desktop screens?

The layout currently has limited responsiveness for mobile, tablet, and desktop screens. Some elements use flexible properties such as percentages, but fixed widths, margins, padding, and table layouts can cause horizontal scrolling on smaller screens. Media queries and responsive units such as %, vw, and rem have not been used consistently. Therefore, the layout works better on desktop screens but should be improved with CSS media queries and flexible layouts such as Flexbox or Grid for proper mobile and tablet support.

2. Which layout technique is used and why?

The layout mainly uses HTML tables, CSS Flexbox, and basic positioning. Tables are used to arrange tabular data and some page sections, while Flexbox is used in places such as the header area to arrange elements horizontally with gaps. CSS properties like margin, padding, width, and position are also used for alignment and spacing. This approach is simple to implement and suitable for a basic student portal, but Flexbox or CSS Grid would be better for creating a responsive and modern page layout.

3. Are typography, spacing, colors, and contrast readable?

Yes, the typography, spacing, colors, and contrast are generally readable. The website uses clear fonts such as Segoe UI and Arial, with suitable font sizes and spacing between elements. The blue and white color combination provides good contrast, making the text easy to read. However, some pages use large fixed margins and inline styles, which can

affect readability on smaller screens. Overall, the design is readable, but spacing and font sizes could be made more responsive.

4. Is the framework used consistently without unnecessary inline CSS?

No, the framework is not used completely consistently because the website contains a significant amount of inline CSS. Many elements use the style attribute for properties such as margin, padding, width, border, font size, and text alignment, while other styling is placed in external CSS files. It would be better to move the inline CSS into the respective external CSS files to make the code cleaner, easier to maintain, and more consistent.

B. Implementation/ Output/Result

Style:

CSS Selectors

body

.box

h1

hr

p

.footer

.footer a

.footer a:hover

CSS Properties

About CHARUSAT

Charotar University of Science and Technology (CHARUSAT) is a premier institution committed to excellence in higher education, research, innovation, and community development. Established with the vision of transforming society through quality education, the university offers a wide range of undergraduate, postgraduate, and doctoral programs across disciplines including engineering, technology, pharmacy, management, computer applications, sciences, nursing, and allied health sciences. At CHARUSAT, students benefit from an industry-oriented curriculum, experienced faculty, modern laboratories, advanced research facilities, and a vibrant campus environment that encourages academic excellence and personal growth. The university emphasizes innovation, entrepreneurship, ethical values, and lifelong learning, preparing graduates to excel in their careers and contribute meaningfully to society. Through strong industry collaborations, research initiatives, and global partnerships, CHARUSAT continues to empower students with the knowledge, skills, and confidence needed to succeed in an ever-evolving world.

D. GitHub Repository Link:

<https://github.com/kanan2007s-sys/Web-development-/tree/main>

E. Challenges Faced:

I faced challenge in designing the webpages . I couldn't align them in the desired manner.
The color combination also took some time.

F. Learning Outcomes:

I learned how to css with HTML . I also learned three types of CSS. How to use CSS with HTML file by giving the path and using the link tag.
